Running the Feature Tests

1) Create a directory and copy the feature test files to it.

2) Place the CLIPS executable in the same directory and then launch it.

3) Enter the command (batch testall.tst).

4) After the batch command has completed, examine the files in the test directory with .rsl extensions. These files indicate any discrepencies found while running the feature tests. If discrepencies occur, you can use a differences program to get a better idea of the differences between the expected output (stored in the .exp files) and the actual output (stored in the .out files).
